High Security Gate (Claw) Lock

Model L8730/8731

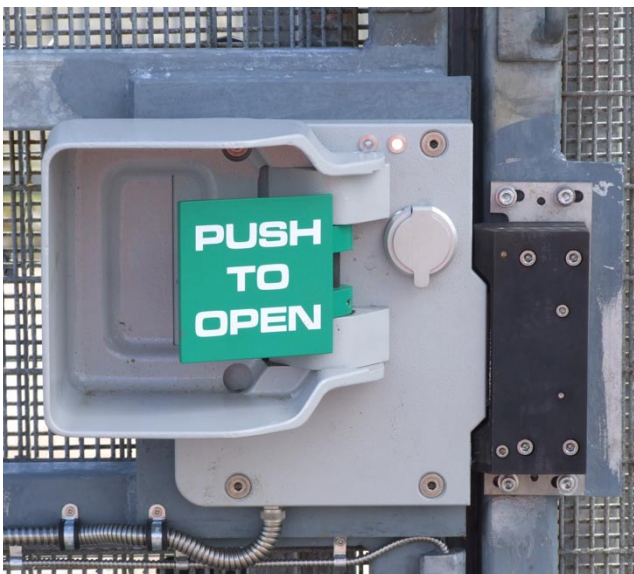

The Kaye High Security Gate Lock – Model L8730/8731

is a heavy duty weather resistant lock fitted with a push-pad operation. The lock throws the bolt and automatically deadlocks on closure. It is suitable for use on external perimeter gates (e.g. electrified perimeter fencing requiring escape function) and features a powerful claw mechanism which engages with a stainless steel adjustable strike.

The UK Government has recognised that the new “claw” type Kaye Gate Lock is suitable for use in high security applications.

The Gate Lock push-pad mechanism may be isolated by using an optional cylinder and key (client free issue anti-drill cylinders and keys). Once isolated, the Gate Lock cannot be used again until the isolation feature is removed.

Typical installation

Close up view of the lock mechanism

Designed and manufactured entirely in the UK, the Kaye Gate Lock uses a robust solid body construction designed to resist the ingress of moisture. The lock is supplied with a 10mm or 20mm solid steel back-plate which is drilled and tapped ready to accept the lock fixing screws.

The emergency push pad is protected by a purpose built metal shroud to provide an efficient obstacle to mitigate manipulation from the outside. The lock is fitted with high visibility LED indication showing main locking bolt position status, which can be hard wired to an existing access control system via the flying leads supplied.

The product has undergone an extensive test programme which has been independently verified by a government department.

FEATURES:

- Push-pad (shielded) action to withdraw bolt
- Close gate to automatically deadlock
- Powerful claw engages with strike on locking
- Adjustable striking plate
- High visibility LED indicators
 - Status Red – unsecured: gate open / bolt not thrown
 - Status White – secured / bolt thrown
- Optional ‘lock down’ facility
- ‘Lock down’ status signal
- Easy to install and maintain
- Available direct from Pickersgill-Kaye Ltd
